### CERATIZIT End Mills with and without Chamfer, with Corner Radius, with Increased Chip Flute

End mills will be reground on the end and the rake face as standard, and on the external diameter as needed. If the end is too severely worn and/or tool chipping is too great, the end will be cut off and reground below the damaged area. For tools with reduced neck, the neck diameter will also be reground. Coated cutters will be recoated with their original coating.

### CERATIZIT Ball Nose End Mills

Ball nose end mills are reground on the end only, as grinding the rake face would make the cutting diameter and thus the radius smaller. If the end is too severely worn and/or tool chipping is too great, the end will be cut off and reground below the damaged area. For tools with reduced neck, the neck diameter will also be reground. Coated cutters will be recoated with their original coating.
